

Scope of Work for Dimock Groundwater Site

This Scope of Work (SOW) is to develop and execute a sampling plan and prepare subsequent and appropriate reports. In order, to prepare these reports a comprehensive history of the groundwater quality as it relates to the hydraulic fracturing and other drilling activities is also required.

The contractor will prepare a detailed sampling plan based on their research and information provided by the OSC. The contractor will then, at the direction of the OSC, execute the sampling plan and collect groundwater and surface water samples at approximately 20-30 locations. Most of these locations will be residents; some surface water bodies may be included. Additionally, if opportunity allows water and other media samples may be collected.

It is estimated that field activities will take about 10-20 days.

Other analytical services that cannot be provided in a time critical fashion and cannot be supported by Fort Meade or CLP will likely be required. Hence , funds are being included in this IGCE.
